----------------------	-------

Domains

varchar(255):

Dname, State, City, Address, Director, MName, Release Date, Rating, Actor,
Language, Description, Genre, AName/AwardID, Winner, CName

int:

DNumber, Zip Code, MovieID, Run Time, English Subs, Funniness, Won, AYear,
CNumber, Evaluation

Assumptions

- Assumed no need to specify a specific range of char in varchar to allow for any length string to be processed.
- Assumed that Won and English Subs can be represented by 0 or 1 to indicate true or false.
- Assumed that NULL can be used for Funniness or Description in the case that a movie is not a comedy or is not a drama.
- Assumed that Run Time is represented by minutes of total length in int format.
- Assumed it was okay to add in a movieid tracker to better keep track of movies within the overall structure of the database.
- Assumed release date was in varchar using month day year.
- Assumed stitching together of full address was fine.
